

Key Findings

- Frances Tiafoe and Learner Tien lead the overall results with win rates near 68%, followed closely by Taylor Fritz and Tommy Paul.
- Learner Tien has combined strong overall performance with a 75% hard-court win rate and excellent deciding-set and tiebreak results.
- Taylor Fritz has the strongest qualifying grass-court record at 80%, while Ben Shelton leads on hard courts at 73%.
- Ben Shelton recorded six wins at the Canada Masters, the highest total by one player at a single tournament. Taylor Fritz earned four wins at Wimbledon.
- Zachary Svajda leads with six victories over higher-ranked opponents. Although this can be interpreted as skewed since higher ranked players don't get the chance to play against higher ranked opponents as much as a lower ranked player. Alex Michelsen, Ethan Quinn, Learner Tien, and Michael Zheng each have four.
- Results became more stable as the season progressed, with the leading Americans maintaining cumulative win rates of approximately 60%–70%.

Tommy Paul: Serving and Returning Findings

Note: Individual serve and break findings on selected player Tommy Paul...feel free to change to any other player in the workbook for their individual stats:

- Paul's first-serve points won rate was generally strong, frequently ranging from approximately 70% to 90%. His best combined serving performances came against Alejandro Davidovich Fokina, Zizou Bergs, and Tomas Martin Etcheverry.
- His second serve was considerably less consistent. It fell near or below 40% against João Fonseca, Agustín Tirante, Learner Tien, and several other opponents, creating a clear area of vulnerability.
- Paul generated his most return pressure against Alexandre Müller with 16 break-point opportunities and seven conversions. He also created 14 opportunities against Casper Ruud, but converted only two.
- His strongest conversion performances included four of five opportunities against Etcheverry and five of eight against Davidovich Fokina. The 100% result against Fonseca came from only one opportunity.
- Break-point saving varied substantially between matches, ranging from 0% to 100%. This suggests that Paul's performance under pressure was less consistent than his first-serve effectiveness.
